

SYSTEM AND METHOD FOR VOICE ORGANIZER MESSAGE DELIVERY

ABSTRACT OF THE DISCLOSURE

The present invention is a voice organizer system having a message intake module, for storing a voice organizer message created by a first user, and a message delivery module. The message delivery module includes instructions for delivering the voice organizer message to a second user on a date specified by the first user, and periodically redelivering the voice organizer message at a frequency specified by the first user. The message delivery module may also include instructions for associating a passcode with the voice organizer message. The message delivery module may further include instructions for automatically calling the second user on the delivery date specified by the first user, and, if delivery of the voice organizer message fails, placing the voice organizer message in a voice mailbox associated with the second user.
